Hi,

We publish our code to GitHub so that users can freely access it, whether to build upon it or modify it for their specific use cases.

Regards,

william jones

Hello,

I'm reaching out regarding the [Argon40Tech/Argon40case](#) repository on GitHub. I noticed that the repository does not currently include a license.

I'm working on a Raspberry Pi project that integrates the Argon ONE case logic, and I would like to create a Rust-based port of the existing Argon40 scripts. My intention is to make the Rust implementation open source and distribute it as part of the project and as its own repo for use on any OS.

Would Argon40 be willing to grant permission to modify and redistribute the code from the repository for this purpose? If so, is there a particular license or set of terms you would like the resulting work to follow?

Alternatively, if you are planning to add an open-source license to the repository, I would be happy to follow that license.

Thank you for your time,

William Jones
